Introduction

Gulf manufacturers is one of Rawasi Group companies that's widely spread in Arab countries. GM is one of the major manufactoryes of pipe and fittings in local and international market, which establish a group of factories to produce all type of plastic pipes and fittings such as (UPVC, CPVC, PE, PP-r) based on the previous experience in the field extended for more than 40 year. In GM factories we use European technology in all production lines to insure the best quality of our products to guarantee passes all the laboratory testes according to international standards. our technical support department embrace a well equipped team engineers , always ready to fulfill any kind of requirements and support our client with all propels, advices also provide site demonstrations and training for handling, joining and installation of plastics pipes and fittings (UPVC, CPVC, PE, PP-r). as a result for our clients confidence and satisfaction the national organization for potable waters and sanitary drainage cuthauiged GM pipes for MDDE (yellow) and HDPE (orange) for using in local and international market for gas application. In GM we believe in building a long-term business relationship with our customers based on confidence and reliability.

Best regards
Gulf manufacturers company GM. RAWASI

HDPE review

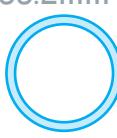

The PE raw material has three generations that started early in 1950 with PE32 & PE63 as 1st generation, 2nd generation, is PE80, and the last & 3rd generation is PE100 early in 1990 which has high performance and economical solution for all application also that stands & that's suitable for different applications (drinking water, sewage, natural gas..etc) to fight the other traditional pipes.

The main difference between PE80 & PE100 (both PE80 and PE100 is high density polyethylene).

The main difference between PE80 & PE100

(Both PE80 and PE100 are high density polyethylene)

(Table 01)

	PE80	PE100
Min. required strength (MRS)	8 Mpa	10 Mpa
Density	> 0.940 gm/cm ³	> 0.940 gm/cm ³
Elongation at Break	> 500%	> 500%
Pipe P560 PN 10	SDR 11	SDR 17
Min.thickness	41.2mm 	33.2mm 
Weight per meter	66.9 Kg	54.8 Kg

PE100 is more economy than PE80

Advantages of GM PE Pipes

1. High flexibility which allows the network Pipes for elbows to save cost.
2. Excellent traffic load resistance due to its structure which specified as visco_elastic material.
3. PE pipes networks are leakage free as a results for joining by butt fusion welding which form the network as one pipe.
4. Excellent impact resistance.
5. Small pipes diameters deliver in coils which save time and installation cost.
6. Less installation cost due to carrying out all pipe welding outside the trench.

7. Excellent water hammer resistance compared with other type of pipes, the HDPE pipes have visco_elastic behaviour which allow the pipe to return back to original shape without any effect.
8. His not affected by harmful material exicted structure of soil for that is not need to cathodic protection.
9. HDPE fittings don't need thrust blocks.
10. High resistance for chemicals at different temperature (see tables).
11. Excellent compatibility with lifting soil.
12. Excellent resistance to U.V radiation - Radiation.
13. High abrasion resistance
14. Do not change the colour and taste of water, for that it is considered healthy.
15. It is impossible for plant and tree roots to enter in the pipes.
16. Appropriate for under water installation and are not affected by sea water or sea movements.
17. Quick installation.
18. Continuous work without any problem at nominal working pressure for minimum of 50 years.

Different uses for PE pipes

Water Networks:

GM HDPE pipes are used for potable water networks which its not affecting the water properties or validity, as it is chemically inert. In addition, the networks are totally safe and very secure from any leakage problems resulted from water hammering due to the joining methods using butt fusion welding and its high flexibility.

The smooth surface which prevents any kind of bacteria to accumulate makes GM pipes is the most suitable choice when dealing with potable water

Sanitary and industrial drainage:

GM HDPE pipes are used for both sanitary and industrial drainage due to their excellent chemical resistance for (Acids, Alkaline, Salts, ..etc) and their non-penetration nature, besides the network leakage free.

Fire fighting system:

Fire fighting networks suffer from water hammer due to sudden opening and closing valves therefore, HDPE pipes are suitable for these networks with their high resistance for water hammer, this phenomenon (water hammer) has been taken into consideration while drawing regression Curve, which decided the life of HDPE pipes as 50 years (see Chart 01 & .02).

Irrigation flexibility:

Due to flexibility, GM HDPE pipes have one high resistance for environmental conditions, especially ultraviolet rays. Same as PE pipes. One considered the optimum choice for irrigation networks by using it up ground and under ground.

Natural gas networks:

There is no alternative for PE pipes in natural gas networks for their high security levels.

The medium density polyethylene (MDPE) PE 80 yellow colour are used up to 5.5 bar according to PL2 - 1.

GM HDPE (PE 100) pipes with orange color are used with working pressure up to 7.0 Bar according to PL2 - 8. The feeding lines of PE pipes also can be squeezed off in order to stop gas flow during repair & release it again after repairing, according to the regulations of each country.

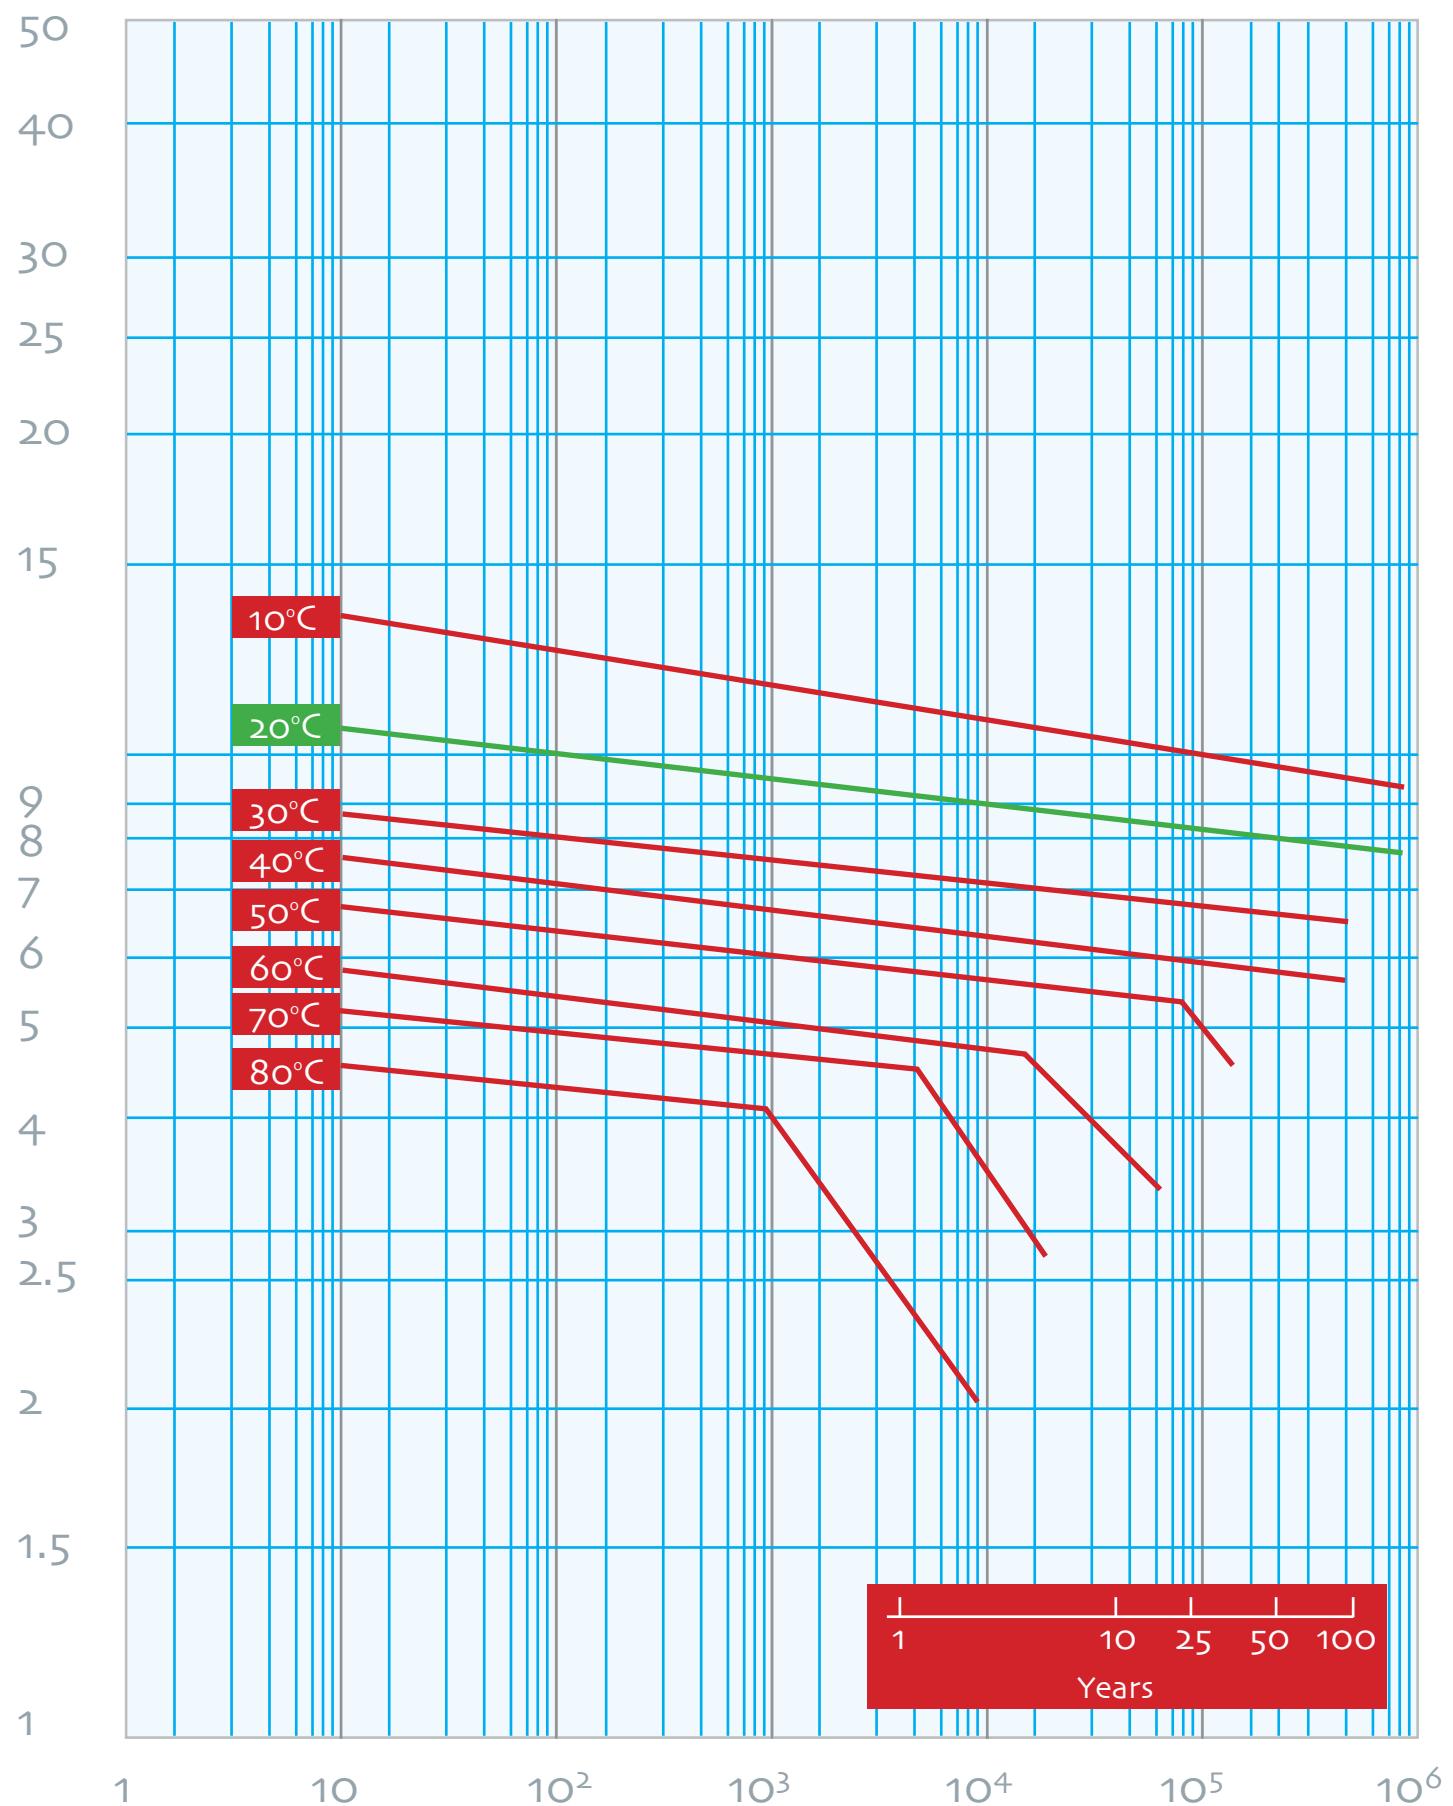

Food stuff transmission lines:

GM (HDPE) pipes are used in foodstuff transmission as (milk products and corns).

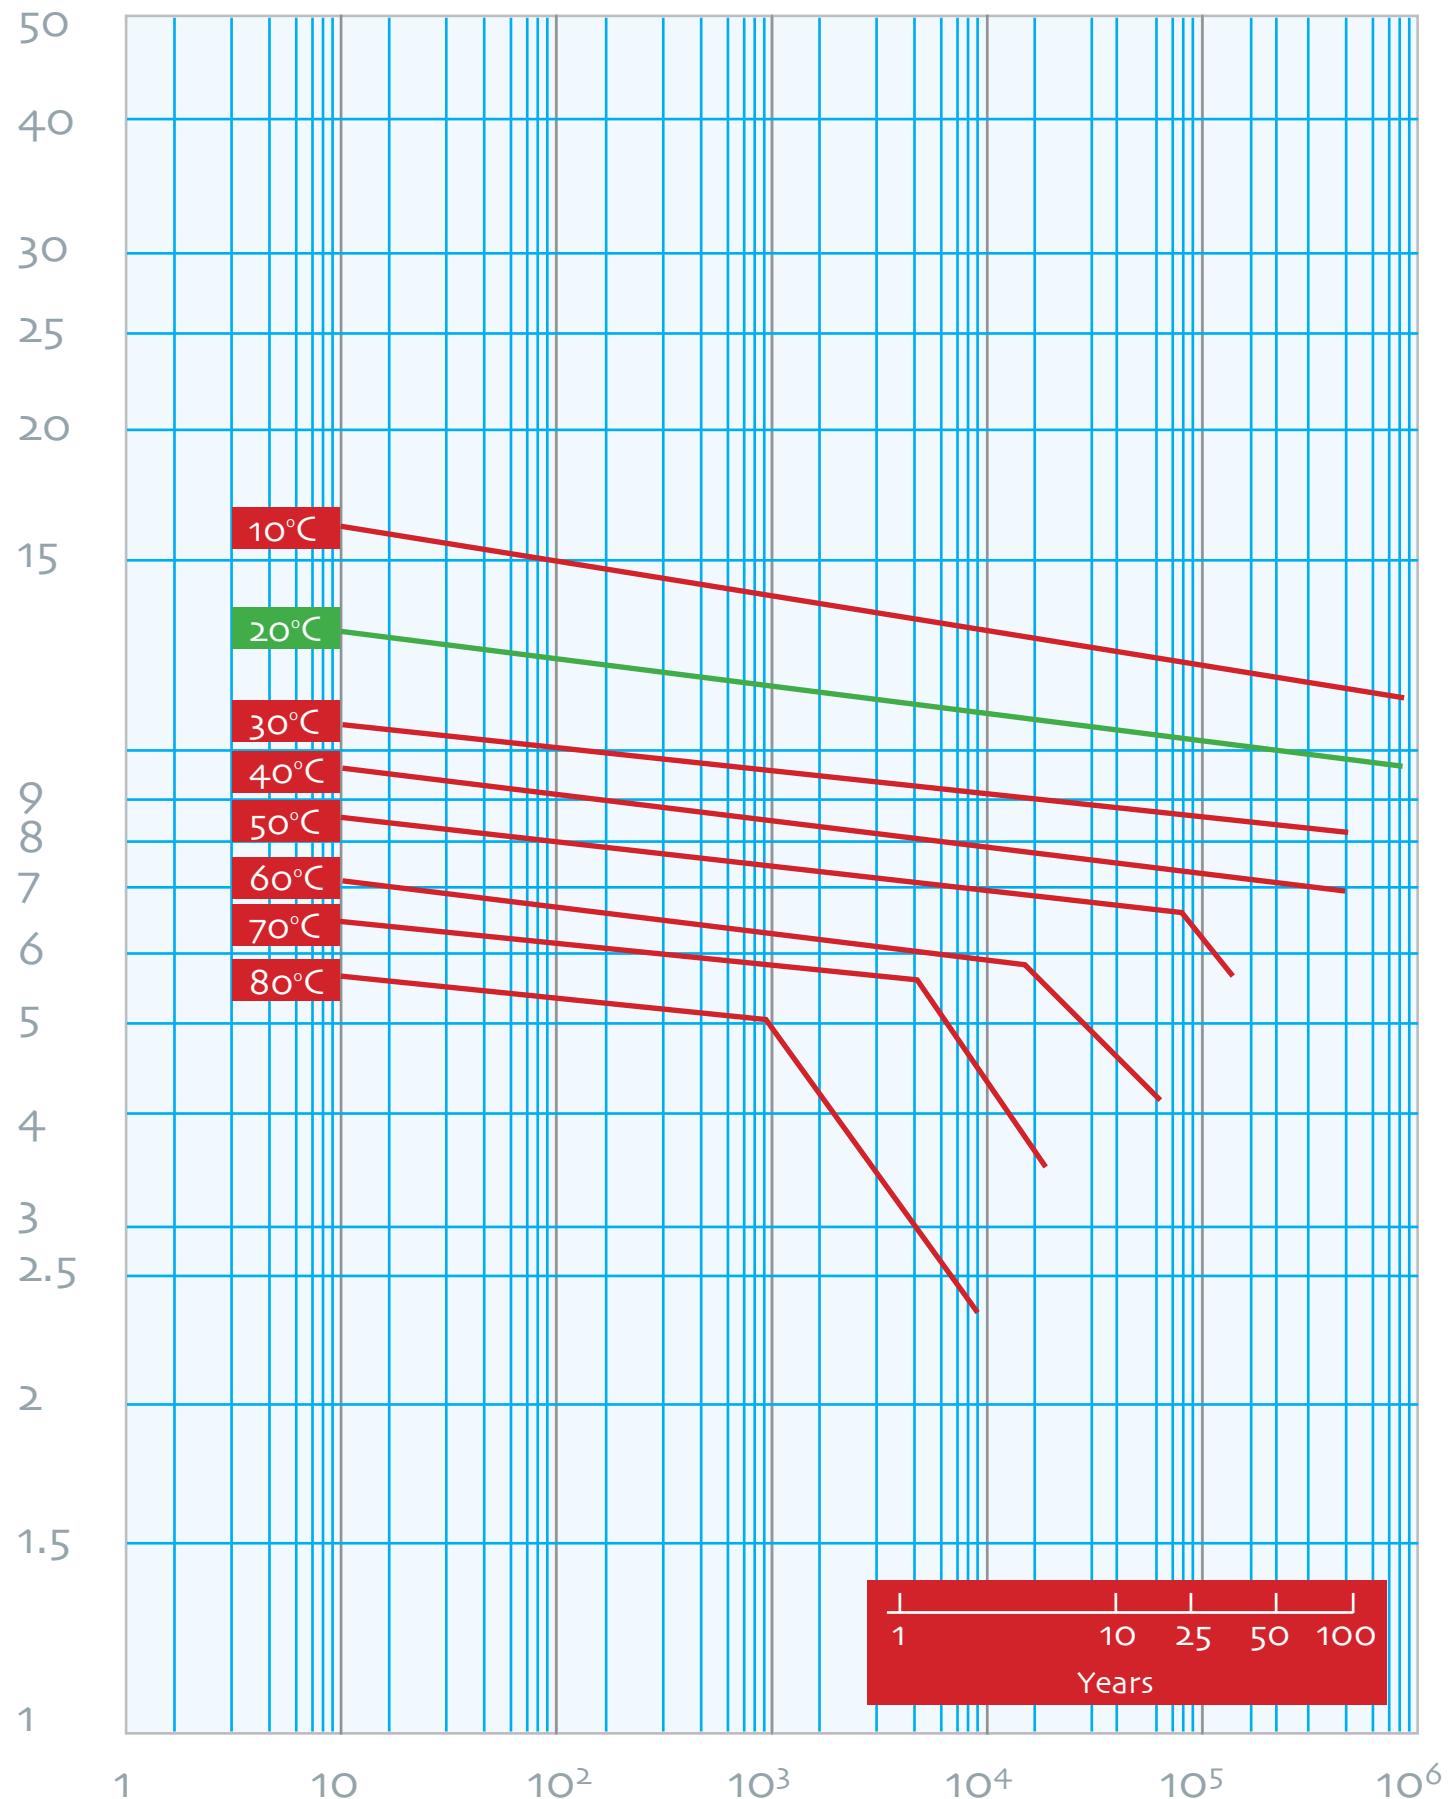

Other uses:

- Siphons under canals, railway lines & aircraft runways where the pipes are installed by directional drilling.
- Cables ducts.
- Water injection system of oil wells.

Log scale: Chart o1 Endurance Diagram of PE 80 Pipes According to Temperature

Log scale: Chart o2 Endurance Diagram of PE 100 Pipes According to Temperature

GM Pipes system

Standards

- Potable Water, Sanitary and industrial Drainage, Fire fighting Networks,..etc
the DIN 8074 / 75, EN 1221, ASTM, ISO & Egyptian Standards can be applied.
- For Natural Gas Networks BGC PL2 - 1 / 8

How to describe PE pipes:

- PE Pipes are described with outside diameters according to GM catalogue or international standards.
- Decide the type of HDPE {PE 80 (MRS^{*} 8.0 MPa) or PE 100 (MRS^{*} 10.0 MPa)}
- Dicted the mean out side diameter.
- Then the working pressure is specified directly from the table of dimensions or by using SDR^{**}

$$(SDR^{**}) = \frac{\text{MEAN OUTSIDE DIMAETER}}{\text{MINIMUM THICKNESS}}$$

- ^{*}MRS: min. required strength
- ^{**}SRS: Standard dimension ratio

GM Pipes system

Laboratory tests at GM Labs

Firstly:
Acceptance tests for raw materials:

These tests are carried out according to the international standards (DIN, ISO, EN, BS, ASTM, Eg, BG requirements) GM labs.

Density:

This test is carried out by using a programmable apparatus through sensitive scale with accuracy up to 0.1 mgm.

Melt flow index:

This test is carried out by using a programmable apparatus, which has the procedure of test according to international standards as built in.

Moisture content:

This test is carried out by using a programmable apparatus, which measures the moisture content in the raw material.

Oxidation induction time:

A programmable carries out this test at different temperature according to international standards.

Secondly:

Tests on PE Pipes & Fittings which are used in potable water, sanitary drainage, fire fighting networks ..etc..

All test carried according To international standards:

Diamenions measurments:

appearance, this means outside diameter, wall thickness & the ovality of pipes.

These are measured by using instruments with accuracy up to 0.01mm. these dimensions are measured. Also by using ultrasonic facility equipped with GM production line.

Tensile test:

This test is carried out by using tensile machine, which has the facility to record the yild stress and elongation percentage through PC unit equeppied with tensile machine

Oxidation Induction Time:

This test measure the oxidation induction time of pipes at different levels of wall thickness (outer surface, middle of wall and inner surface).

Heat revesion test:

This test is carried out by using a furnace with accuracy 0.1°C and a marking apparatus with accuracy 0.01 mm.

Hydrostatic pressure test:

This test is carried by using hydrostatic pressure station and conditional tanks (20 °C, 80°C) which is controlled by PC unit, to hold the pressure test value constant during test period.

Laboratory tests at GM Labs

Tests which are carried on the pipes used in Natural Gas Networks:

All tests are carried out according to BGC-PL2 - 1 for MDPE (PE8o) with yellow color & BGC-PL2 - 8 for HDPE (PE100) with orange color.

Batch release test programme for pipes:

(Table 08)

Description of test	Initial frequency of test
Density	Daily, rotating sizes and machines
Melt flow rate	Daily
Outside diameter and wall thickness (wall thickness monitor shall be used)	Every 2h for each size and machine
Ovality of coiled pipe on coil/drum (90 mm and above only)	Every seven days or each batch from polymer supplier as appropriate
Pigment dispersion	Every seven days or each batch from polymer supplier as appropriate
Oxidation induction time	Every seven days on pipes, rotating sizes and machines
Pipe end circumferential reversion	On start up then every working shift of production for each size and machine
Tensile strength and elongation	Every working shift of production for each size and machine
Hydrostatic pressure resistance at 80 °C (unnotched pipe) (below 63mm only)	First product from each extrusion run then one sample/size/extruder per week
Hydrostatic pressure resistance at 80 °C (unnotched pipe) (63mm and above only)	First product from each extrusion run then one sample/size/extruder per week

Pressure test method on site for P.E pipe lines

First method:

- 1- the PE Pipe line must be filled with water 24 hours at least prior to the starting of the pressure test
- 2- ensure that the system is entirely ventilated
- 3- calibrated pressure indicator must be installed with the system.
- 4- Start raising the pressure gradually
- 5- Stop the water pumping at 1.5 working pressure of P.E pipes.
- 6- Keep the pressure for two hours and feed the system with water to compensate the drop of pressure during the first hour as a result of a relaxation phenomenon.
- 7- The permissible drop of pressure during the second hour around 15% of pressure test, some factors can be affected by increasing or decreasing the percentage of pressure drop such as pipe network length, pipe diameter, thickness of pipe, (the suitable length is 500 meter, and temperature is 20°C).

Second Method:

- 1- The steps from 1 to 5 Completely done.
- 2- During the 2 hours after the network reaches to 1.5 working pressure, the pressure value must be compensated.
- 3- The drop in pressure in this case around 5% and depending on length of pipe line, ambient temperature (Suitable length is 500 meters and temperature is 20°C).

Notes:

The working pressure calculated at 20 °C for 50 years according to international standards definition for that when the pipe line tested above ground, the working pressure will be changed against ambient temperature changed see table
(09, 10) working pressure against temperature at 50 years.

Joining Methods for PE pipes

Butt fusion welding:

This method is carried out as follows:

- fix the pipes at welding machine with clamps
- clean the outsides and inside surfaces by dry cloth
- Match the ends of both pipes using milling machine provided with the welding machine.
- Insert the heating mirror between the two ends of pipes (temperature 210 °C) and apply the pressure on pipes according to table provided with the machine
- Wait till the bead of weld reach approximately 2mm.
- Release the pressure applied on welded pipe (heat up), leave the pipe at the necessary time according to the welding table provided with the machine.
- Remove the heating mirror
- Join the surfaces and increase the pressure up to the value in the welding table provided with the machine
- Check the welding visually.

Electro fusion welding:

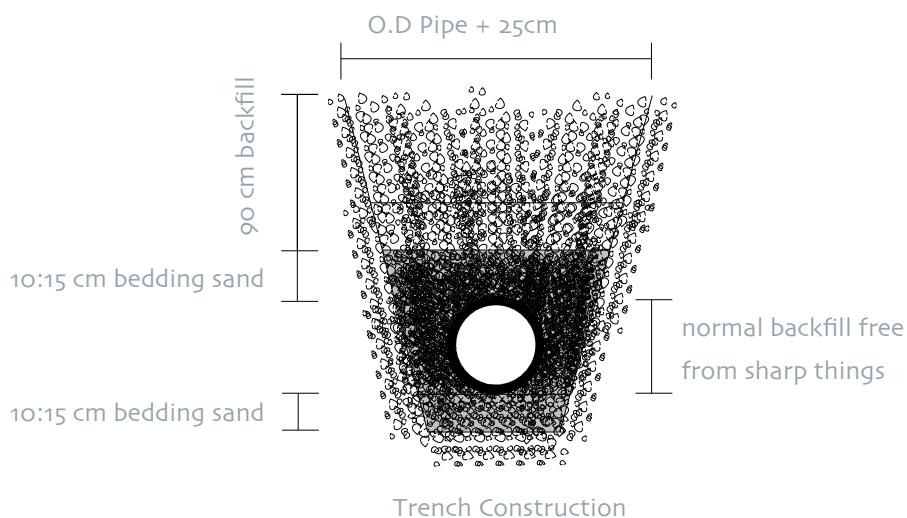

This method is carried out by using a coupler having coil built in and special machine as follows:

1. scrape the part in outer surface of the pipe, which will be connected with the coupler.
2. Clean the two surfaces of both pipes
3. Insert both ends of the two pipes inside the coupler
4. By using bar code, feed the electro fusion machine with a welding parameter founded in coupler.

Some of the installation Techniques for PE buried pipelines

Installation at open trench:-

Due to the possibility of welding PE pipes outside the trench and draw it after welding, the trench should have a narrow width which reduce the digging costs. In general, the trench width is about (outside diameter + 25cm) the trench construction and dimensions are shown in the below

Notes:

The dimensions mentioned in this figure one used as a reference dimensions, the contractors should review this dimension with GM technical support department

Directional drilling:

This method is carried out by using a drilling tool equipped with a directional apparatus to avoid any obstacles (pipes, cables, ... etc) during drilling. After the drilled reaches the required dimension, weld the pulling head to PE line and drop it inside the hole as shown in the above figure:

Transmitting, Hadling and storing PE pipes

Instructions for handling & storing PE pipes

1. avoid dropping the pipes on the ground while downloading them.
2. Avoid any metals to touch the pipes.
3. Avoid exposing the pipes to direct sunrays.
4. The storing place must be away from any heating sources
5. Storing must be on a flat ground the height of storing the pipes shouldnt exceed 1.5 meter, pipes should be stored in a pyramidal shape.

Transmitting & downloading the pipes:

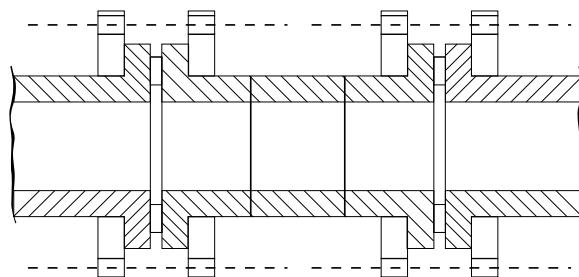

- The pipes are transmitted on wooden walls in a pyramidal shape or in bundles as shown in figure
- The pipes are downloaded by using cranes, avoid using metal belts touching the pipes
- Pipes also can be downloaded by rolling them on wooden walls.

Repairing methods for PE Pipes

1. Using stub flanges:

The steps of repairing are as follows:

1. Cut the defected part of pipe
2. Weld the stub flange at each of the pipes ends
3. Replace the defect pipe with the same length of good pipe equipped with two stubflange.
4. Assemble according to the figure below

2. using steel coupling:

this methods is carried out by using steel coupling equipped with rubber sealing as follows:

if the damage is small that it can be covered through the coupling area, it can hold the coupling directly at the damage area.

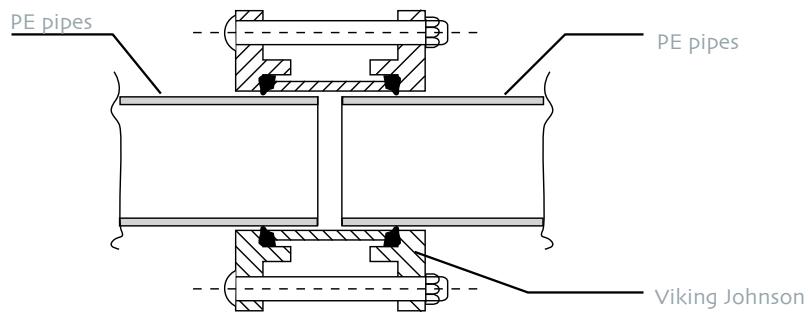

If the damage couldn't be covered by coupling, follow these procedures :

- a. cut the defected pipe part
- b. Assemble the new pipe instead of the removable part using the two steel coupler as shown in the figure:

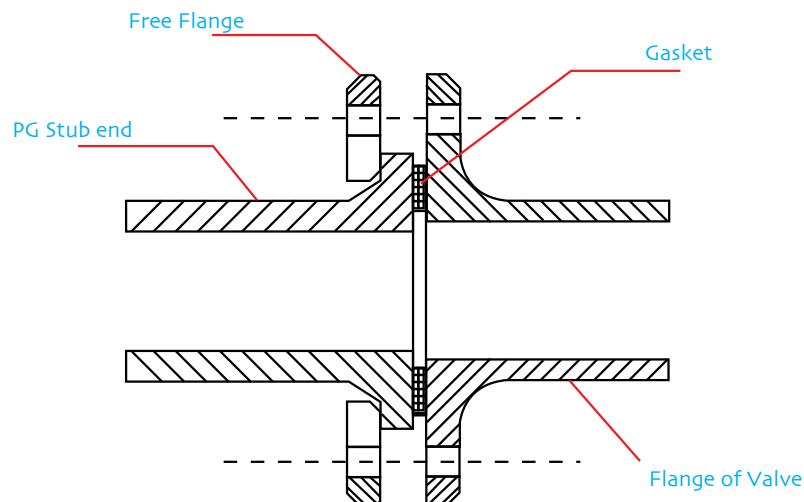

3. Using Viking Johnson:

This method has the same procedures as steel coupling the below figure illustrates the Viking Johnson fitting and how to fit it with PE pipes.

Joining by using stub flange:

This method is carried out by using stub flange with free flange to join the PE pipes with other types of pipes or valves as shown in the figure below

Effect of Chemicals on HDPE:

The following tables illustrate the effect of some of the chemical materials (acids, alkaline, salts,...etc) on HDPE pipes on different temperatures according to the following symbols:

Susp.	Suspension prepared in saturated solution	op.sol.	Operational solution
Sat.sol.	Saturated liquid solution	R	Resistance

HDPE GM FITTINGS

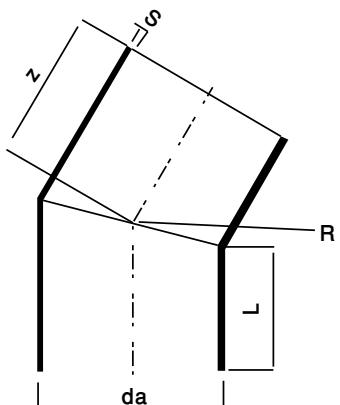

GM fabricates segmented HDPE fittings (Elbows, tees) according to the dimensions in this catalogue. GM can also fabricate the segmented fittings with special dimensions according to customers request.

Stub flanges and reducers are fabricated according to the dimensions in this catalogue by machining operation or injection also GM can manufacturers reducers and stub flanges with special dinemsions according to customer request. All HDPE fittings are tested according to international standards.
